

Electric Motor, Tailgate

Electric motors for the tailgate enable the automatic opening and closing of the trunk. They typically consist of an electric motor with a gearbox and spindle mechanism that controls the movement of the tailgate. These motors are used in modern vehicles equipped with electric or sensor-controlled tailgate systems.

Defects usually occur due to mechanical wear, particularly from material fatigue or worn gears in the gearbox. In addition, moisture can penetrate the system, leading to corrosion or short circuits in the electronics.

With a carefully selected product range, we cover more than 1,500 relevant vehicle applications.

In-house product development and testing in our laboratory, as well as long-term testing in collaboration with our workshop partners, ensure the high quality and reliability of #GEBE products.
